

SuSi small windturbines for individualists

Autarkic energy supply for home requirements.

Environmental protection against overexploitation of wood from bushes, trees or fossil energy carriers

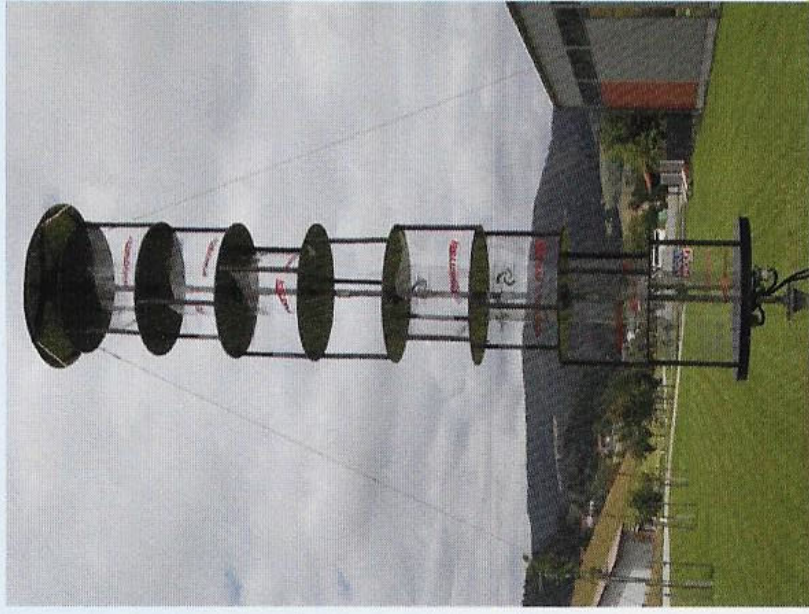

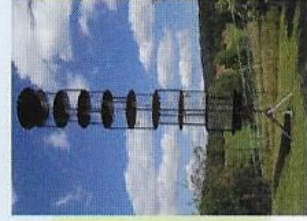

Energy use as “isolated solution”

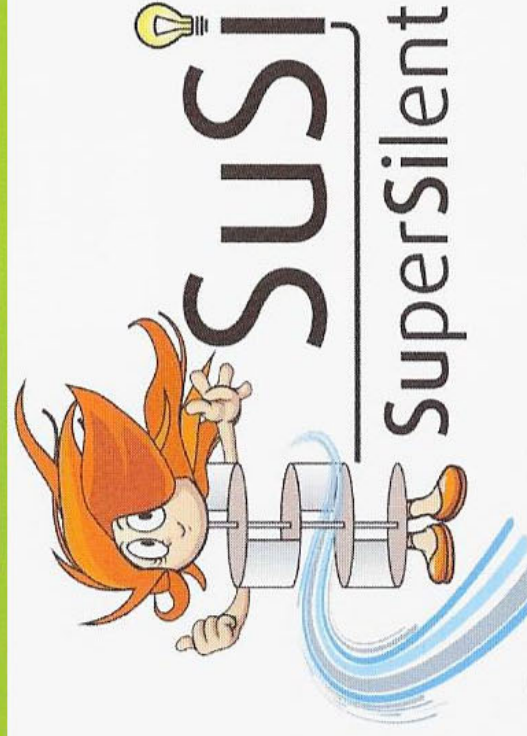

EURO-WINDPOWER oHG
<https://www.euro-windpower.eu>

A newly developed wind capture unit for worldwide use, combined with the principle of a vertical small wind turbine, is used for power generation onsite, regional and decentralized – directly at the user of the energy! It can be simply delivered to any place via haulage and can be easily installed by most people themselves (DIY).

The special thing about SuSi SuperSilent wind energy turbines is that they can capture wind and each gust from any direction. They can convert windenergy into electricity during rotation. Batteries store the electricity to be available by the user when required.

European Union
European Regional
Development Fund

- **Transparent wings** accepted by the neighbourhood due to nice appearance
- **Silent motion** if wind drives the capturing unit with no danger through subsonic noise, no noise pollution, different from wind propellers
- **Ecological materials** are used for the entire design -> ecological concept of sustainability!
- **Modular design** which means that size and performance can be adapted any time to conditions on site (family home, caravan etc.)
- **No authorization required** in many federal states and other countries due to a maximal overall height of less than 10 m from mast step.
- **Installed within a day** if a stable foundation exists for mast step and ground anchors
